

brief introduction:

The barcode device provides a complete solution for accurate, easy to use and fast data entry and storage for computer information systems.

The company has another infrared automatic sensing technology.

This product has "manual type" and "automatic induction type" two working modes.

This product also provides a complete interface mode to accommodate the computer systems of various hosts:

Keyboard

RS-232

USBIID

VCOM

All decoder parameter settings can be completed by scanning the barcode and stored in the stored memory, retaining the settings after the power is turned off. Product functions are not all listed in this manual, please contact the supplier for more details. All rights, including the final

interpretation of this instruction manual,
are reserved by the Company.

The *---manufacturer has the default
settings

D (Decimal) - - - -Numerical parameter
setting (required with a decimal data code)

H (Hex) - - - -Character parameter setting
(with hex data code required)

1. Basic property settings of the scanning gun

1.1 System initialization settings

After system initialization, all parameters are restored to the factory setting. Initialization must scan the following 902000 bar code. All the initialization parameters are detailed in Appendix A.

System initialization settings

1.2 Display the software version number

When the barcode gun scan as above 000011 barcode success, the corresponding position on the computer screen will display the corresponding software version number.

Display the software version number

1.3 Sound Setting Options

(1) Sound on and off

When the barcode gun is scanned as follows as 002001 bar code, the system will open the buzzer.

When the barcode gun scan below 002000 barcode success, the system will turn off the buzzer.

* open

002001

close

002000

(2) Tone / loudness adjustment

When the barcode gun scans the following
002049 bar code

Will enter into the corresponding frequency

* close

203030

1.9 Same barcode identification interval under continuous scanning (D)

Incomplete delay is when the delay time ends when the environment changes. A complete delay means that, regardless of the environment, it must be delayed for enough time to read the same barcode again. (When the barcode gun scans the following 20102 barcode, the corresponding data code enters the corresponding setting (see Appendix C for the data code). Scan the data code

Then remember to scan the save code.)

Set the same barcode read delay time (default 5, range 2
-50 in 100 ms)

201016

1.10 Bar code output confirmation level

Some bar codes need to be confirmed repeatedly before output to avoid miscodes. The lower the confirmation level, the faster the barcode reading speed, and the higher the code error rate. The higher the confirmation level, the slower the barcode reading speed, and the lower the code error rate.

* zero level

210000

one-level

210001

1.11 Barcode ID identification option

The barcode ID is used to identify the identity of the barcode, as indicated by a 1-bit letter. Barcode gun scanning the following bar code can achieve this function.

ID

307001

* ID before
barcode

307000

1.12 Keyboard Language (D)

The language type used to set the output barcode to the computer supports 23 languages, please see Table 1 for the 23 countries respectively. The corresponding bar codes of beauty and Germany are as follows. (When the barcode gun scans the following 102000 bar code, the corresponding data code will enter the corresponding keyboard setting (see Appendix C for data code) After scanning the data code, remember to scan the save code.)

Table 1

order number	National keyboard language	Corresponding bar code	order number	National keyboard language	Corresponding bar code
0	Standard American keyboard	102010	12	Dutch keyboard	102022

CODE128	D	UPC-A	L		

CODE93	E	Standard RSS codes	N		
CODE39	F	CODE-32	Q		
Kudeba code	G	China post	R		
Cross 25 yards	H	Standard 25 yards	S		

Table 2

3.3 Character local / global setting options for the barcode

Allows the editing of the characters to be output before exporting the barcode characters. Such as add, delete, insert, etc.

Local setting: the specific code type can be specified for a certain user, the specific code type

Code refer to Table 3 below.

bar code type	Corresponding code name	bar code type	Corresponding code name	bar code type	Corresponding code name	bar code type	Corresponding code name
UPC-E	01	UPC-A	02	EAN-8	03	EAN -13	04
CODE128	05	COOE93	06	COLE39	07	Kudeba code	08
Cross 25 yards	09	Industry 25 yards	10	Standard 25 yards	11	Matrix 25 yards	12
China post a sign or object indicating number	13	MSI	14	COLE11	15	Code32	16
RSS standard	17	RSS prescribe a limit to	18	RSS expand	19		

Table 3

Global settings: code 00 for all bar codes.

When barcode output, comprehensive output will be set according to local and global users, and the judgment conditions are as follows:

If a certain type of edit (such as adding characters before a barcode) has a local setting, but also a global setting, the output is only output as a local setting.

If there are no local settings, but are global settings, output as global setting, for example; the barcode type is CODE 128, which parses to the character of 1234. Refer to Table 4 below for details.

overall situation	part	output
Bar code before the work plus	not have	A1234
Add before barcode	Add B before barcode	B1234

not have	not have	1234
not have	Add B before barcode	B1234

Table 4

With the above foundation, a total of 9 ways to set up are provided.

(1) Filter the barcode before the specified character

For example, the barcode data resolved to is ABC 1234DEFG, and the specified character is

At 1234, the characters before it will not be output, to be 1234DEFG.

Barcode production: 020000000003
 The leading command is the — | — The specified
 Global / local code (see Table 3) • Corresponding to
 the previous one, range

Specifies a visible character with a character length (range of 1 * 9) and a value of 32 to 126.

When the setting barcode is generated with the barcode generation software, the selection code class is CODE 128, and the data source is " 302000000003123.

Reset barcode _____
 production: QB 200 00 | _____ Global /

(2) Remove the same character before filtering the barcode

For example, the barcode data parsed to is AMA1234, and the specified character is A. Then the output result is 1234. Note that the setting must be the same character, and its retrieve rules start from scratch, encounter the specified character as the start, and encounter a character different from the specified character as the terminate.

(3) The same character after filtering out the barcode

The function is similar to the previous setting, except that the retrieval rule starts at the last point.

Barcode making: 0220000001 4 Specify
 The leading command

Reset barcode production; 0B220]

Leading command for global / local code

(4) Turn off the transmission of a specified character

With the character specified in the barcode data, filters the character and outputs other data. For example, if the barcode data is A12A34AA 56789A and the specified character is A, the output is 123456789.

Barcode production: 0230000002 7 Specify the character, ranging to the ASCII
 The leading command

The above meaning means that in the EAN-13 code, close the transfer character 7.

Reset barcode production; QB230 02 Global /

(5) Add the characters

Add a character description from the beginning, from the end, and from in the middle.

(a) Add characters from scratch. That is, to add the specified character to the head of the barcode.

For example, when the barcode 1234, the character to be added is ABC, then output ABC1234.

Barcode production: 02400000 @13 ABC

The above setup code means: adds 3 characters "ABC" to the front end of the UPC-A code.

(b) Add the characters from the end

Features similar to the above settings except for the added position in the tail.

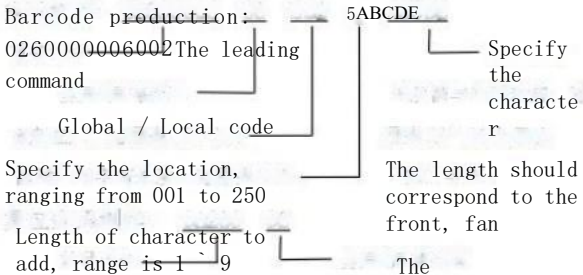

Character length to be added with 1 visible ASCII characters of ` 9.

(c) Add the characters from the barcode

The function is to start inserting the characters to be added at any specified location in the barcode. For example, the resolved barcode 1234, specified position is 1 and specified character is ABC, then output 1ABC 234.

(6) Delete the characters

Delete characters from beginning, from end, from the middle. (a) Remove characters

Starting from the header of the barcode, delete the specified number of characters. For example: parse to

The barcode is ABCD 1234, the specified number of deleted characters is 4, then the output is 1234.

Barcode production: 02700000 06 04

Leading ~~command~~ 1 specifies the characters to be deleted

Global / Local code-

Reset barcode production: 0B27006

Leading command for global / local code

(b) Remove the characters from after the barcode

The function is similar to the above, only deleted from the end of the barcode.

Barcode production: 028000000504

Pleading command •

Specifies what needs to be deleted

Global / Local code •

Number of characters, ranging from 01~05.

(c) Remove the characters from the barcode

The function is to delete the specified number of barcode words starting from the specified location in the barcode

tally. For example: 12345ABC, the specified location is 001, specified

To delete the number of barcodes is 4, then the output is 1ABC.

Barcode production: 0290000004002

Lead command

Specify the word to delete

Global / Local Code I

Specify the location, ranging from 001 to 250

Reset barcode production: QB290 04

The leading command

Global /

(7) Keep the barcode of the specified number of digits

This setup function is to retain only part of the barcode, regardless of the barcode length. component

Described from the beginning and from the end.

(a) Keep the N bit from scratch

Set retains 4 bits from scratch,
regardless of barcode length, only longer
than 4

Bits, and only taken in the first four
positions.

Leading command for global / local code

(b) N bits from the end

The function is similar to the above, only retained from the end.

Barcode production:

02E000000104

The leading command

Global / Local code-

Reset barcode production:

QB2E094

The leading command

Global / Local code

The number of digits to retain, the range is 0199.

(8) Old change

The character replacement function is to replace the specified character with the target character. For example, to resolve the barcode to 1234ABCD 90, now to replace the ABCD of 5678, then the output 1234567890.

Barcode production:

02400000054ABC 556789

The leading command

Global / Local Code I

The length of the character to be replaced

Replaced character, long

The degree matches the length

The consistency, as specified previously.
